

## Past Teams Notes – C&C

---

Date:

*June 23<sup>rd</sup>, 2025*

Researcher(s):

*Christopher Gibbs*

Objective of research:

*Look at past teams and take notes on anything that stands out to us regarding the needs that our sub-team recently decided upon*

Notes:

Merknights 2024 ROV:

ROV is controlled by WASD on laptop keyboard

Uses one camera located at front of ROV for first-person perspective

Uses no sensors to cut costs, the ROV relies on only the camera

Deep Sea Dogs 2024 ROV:

Arduino is located inside the ROV (computations are likely done within the ROV)

Use Python coding

Built most of their ROV from scratch by 3D printing most of the frame (making custom parts could be a good option to help us keep the electronics in an air-tight space)

Clovis Community College 2024 ROV:

Uses three USB cameras

One “main” camera facing forward for pilot and co-pilot to view bow of the ROV and front manipulator

One rear-facing camera that is a 180-degree fisheye lens camera

One camera is a portside camera. Its purpose is to “collect images utilized in the photogrammetric rendering of coral reefs and other subjects observed by the vehicle”
